

Equotip 550 Leeb

Hardness testing of aluminum castings

The standard method of bench top testing is very time consuming, thus costly. Manufacturers aim to optimize the time required for testing. Proceq's Equotip 550 Leeb is providing a simple and quick solution while obtaining accurate hardness values in a fraction of the time of the standard bench top test.

The hardness values are immediately stored within the instrument. The stored data is easily accessed or transferred as required for reporting and archiving using the USB connection. The Verification Wizard feature assures the quality team that the instrument is operating properly and within tolerance prior to use.
